Tools, Techniques and Methods
Thursday, May 8, 2014: 1:20 p.m. -1:40

Outline

- Lower Ordovician Arbuckle Group saline aquifer in Kansas for scCO_2 storage
- Comprehensive log suites and full diameter core data from two anchoring wells (790 m in length)
- 3-D seismic ($\sim 400 \text{ km}^2$) from 5 oil fields; 65 km^2 newly acquired multicomponent (*converted shear wave*)
- Arbuckle – Distinct, and at least locally, isolated hydrostratigraphic units
 - defined by petrophysics, geochemistry, and geomicrobiology
- Independent, multi-scale estimates important in defining effective porosity, permeability (k_v & k_h), and capillary pressure
- Flow Zone Interval (*FZI*), Reservoir Quality Index (*RQI*), and Neural Network used to establish petrophysical correlation to lithofacies and model permeability and capillary pressure for regional storage assessment

Acknowledgements -- The work supported by the U.S. Department of Energy (DOE) National Energy Technology Laboratory (NETL) under Contracts DE-FE0002056 and DE-FE0006821, W.L. Watney and Jason Rush, Joint Pls. Project is managed and administered by the Kansas Geological Survey/KUCR at the University of Kansas and funded by DOE/NETL and cost-sharing partners.

The study is a collaboration, multi-disciplinary effort between the KGS, Geology Departments at Kansas State University and The University of Kansas, BEREXCO, INC., Bittersweet Energy, Inc. Hedke-Saenger Geoscience, Ltd., Improved Hydrocarbon Recovery (IHR), Anadarko, Cimarex, Merit Energy, GloriOil, Dawson-Markwell Exploration, and Noble Energy.

Digital type wells used to archive well information including stratigraphic correlations, geologic reports

CO₂-EOR & Saline Injection, Wellington Field

- InSAR & CGPS
→ surface deformation
- IRIS seismometers & 3C accelerometers

- Tracers to detect injected CO₂
- Monitor ~600 ft deep well below shallow evaporite cap rock

- Test for CO₂ in Mississippian wells
(Underpressured oil reservoir should trap any vertically migrating CO₂)

Inject 28,000 tonnes of CO₂ into Mississippian oil reservoir to demonstrate CO₂-EOR and 99% assurance of storage with MVA

Pending Class VI permit and DOE funding -- Inject up to ~40,000 tonnes of CO₂

- U-Tube, CASSM and cross hole seismic
- DTS & acoustic fiber optics (long string fiber pending)

M. Fazelalavi, KGS

Improved permeability realization in the Arbuckle in Wellington anchor wells

- micro, meso, and mega groups defined in the Arbuckle
- based on core FZI & irreducible water saturation (from MRI)
- permeability computed from FZI value (Fazelalavi method)
 - FZI inversely proportional to surface area per grain volume (S_{gv}):
 - FZI should be inversely proportional to S_{wir} and Φ_e

$$FZI = \sqrt{\frac{1}{F_s \tau^2 S_{gv}^2}}$$
$$FZI = \frac{a}{S_{wir} \phi_e} + b$$

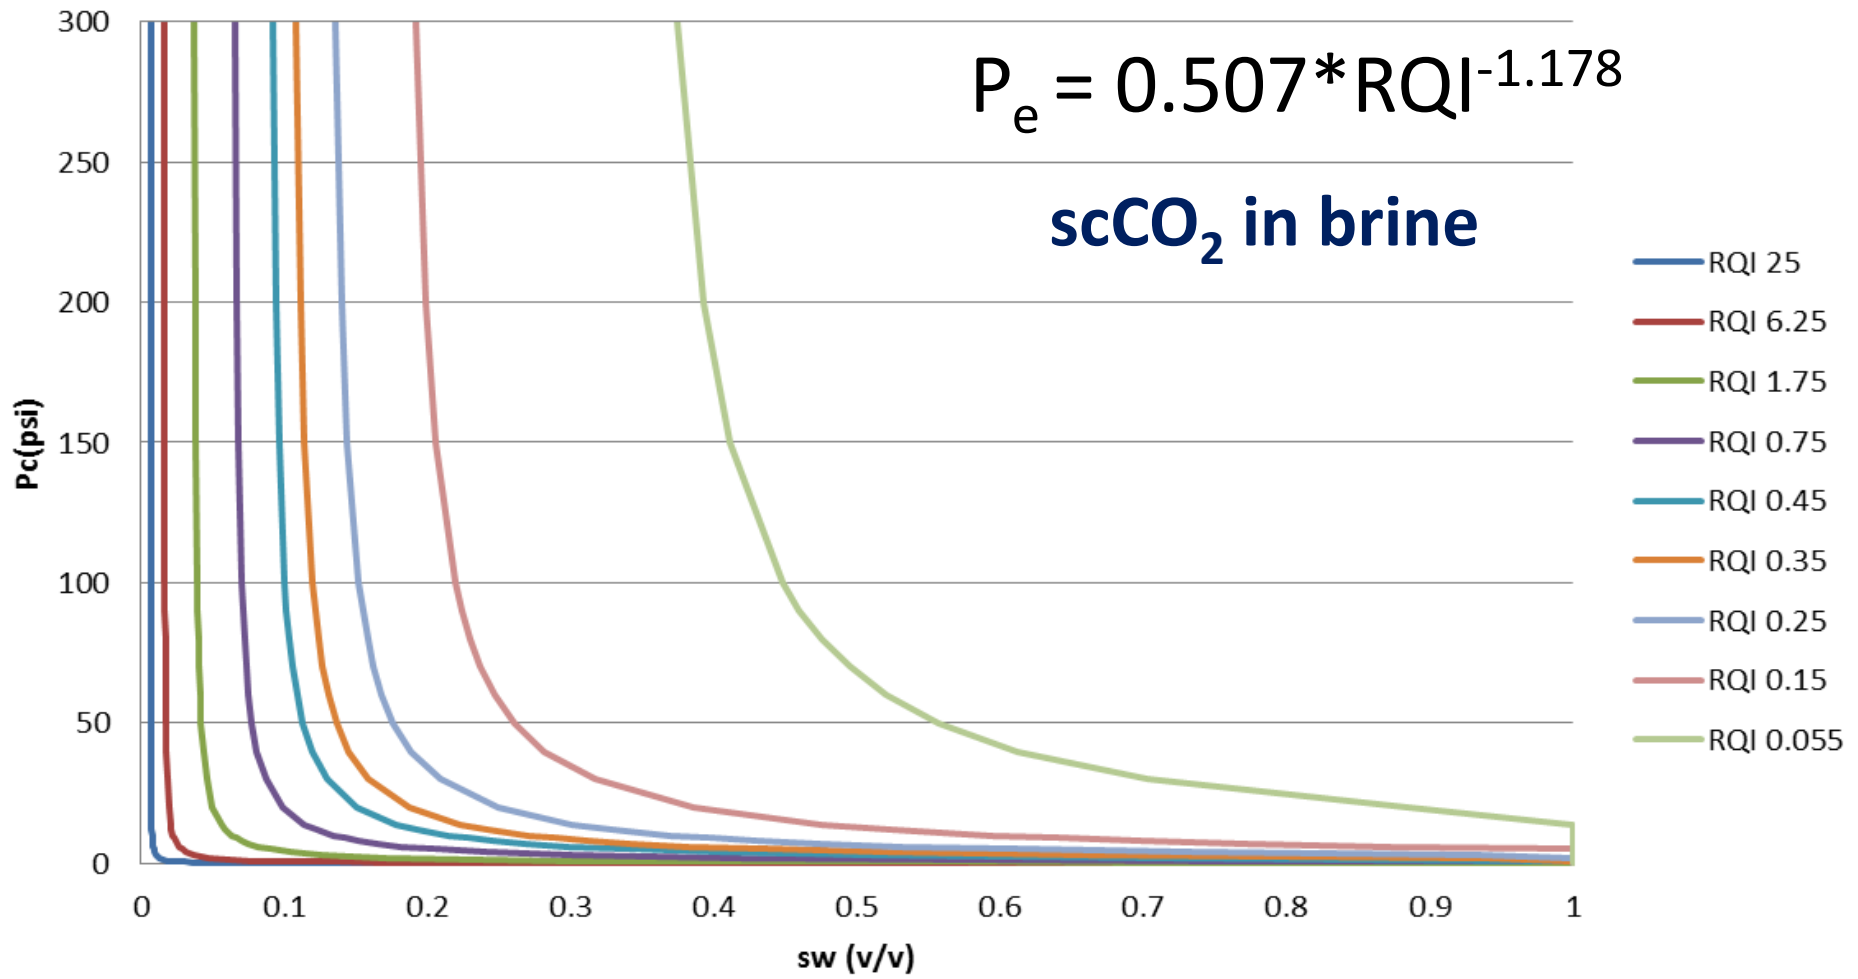

Fazelalavi et al. (2014)

Calculated Drainage Pc for RQI Group in Arbuckle

Correlations Between K_v and K_h From Whole Core Analysis & Five *Petrofacies* Groups

(K_v necessary to model interaction between high flow intervals)

Group 1

There are 15 whole core samples in this group; both vertical and horizontal permeability are less 0.01 mD.

Fazelalavi, KGS

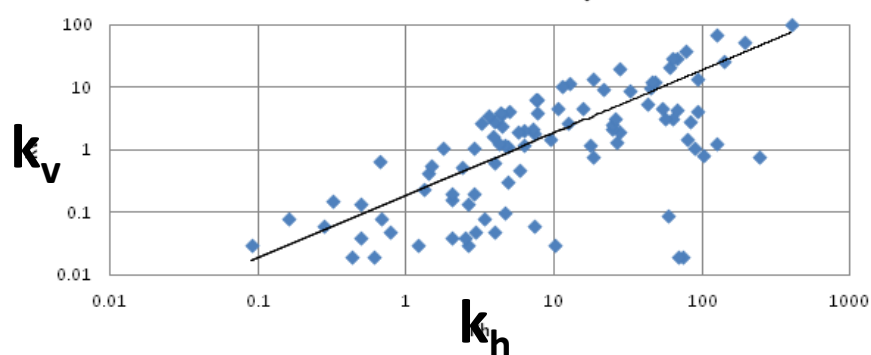

K_v less than 0.01 - Group 2

$y = 2.4484x$
 $R^2 = 0.6916$ $K_v > K_h$ - Group 4

$y = 0.1871x$
 $R^2 = 0.5367$ K_v less than K_h - Group 3

$y = 82.624x$
 $R^2 = 0.9906$ $K_v \gg K_h$ - Group 5

“TRIPLE COMBO” PERMEABILITY PREDICTION FROM LOGS Using Neural Network

RHOmaa and Umaa were not found to contribute significantly to permeability prediction, although they suggest that chertier dolomites tend to be more permeable than dolomites. However, gamma-ray, porosity, resistivity were useful as predictors, and so the model input requirements are from a basic triple combo well log suite common in Type Well Database:

1. GR (Gamma-ray, API units)
2. PHIt (volumetric porosity%)
3. PHIr (connected porosity estimated from resistivity log %)

$$\text{PHIDensity}[] = (2.71 - \text{RHOB}[]) / (2.71 - 1)$$

$$\text{Rwa}[] = (((\text{PHID}[] + \text{PHIN}[]) / 2)^2) * (\text{ResDeep}[] / 1)$$

$$\text{PHIr}[] = (\text{Rwa}[] / \text{ResDeep}[])^{.5}$$

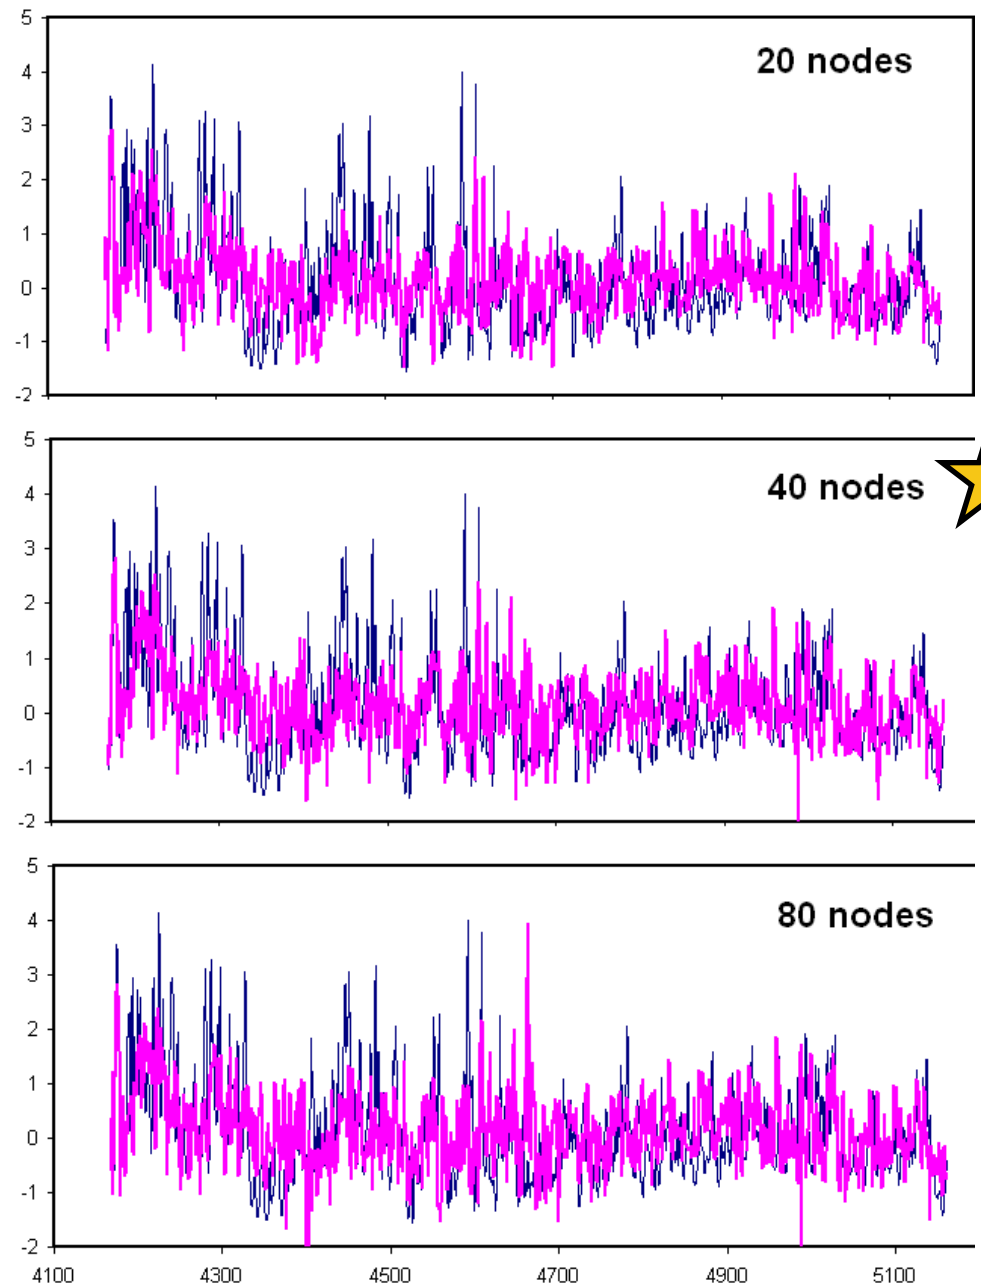

Comparison of k_h permeability in validation well by neural network with different numbers of nodes in the hidden layer

— core-log calibrated
(with S_{wir} & Φ_e from NMR)

$$k = 1014 \left[\frac{a}{S_{wir} \phi_e} + b \right]^2 \frac{\phi_e^3}{(1 - \phi_e)^2}$$

— predicted

log-scaled permeability

Flow units in the lower Arbuckle injection zone

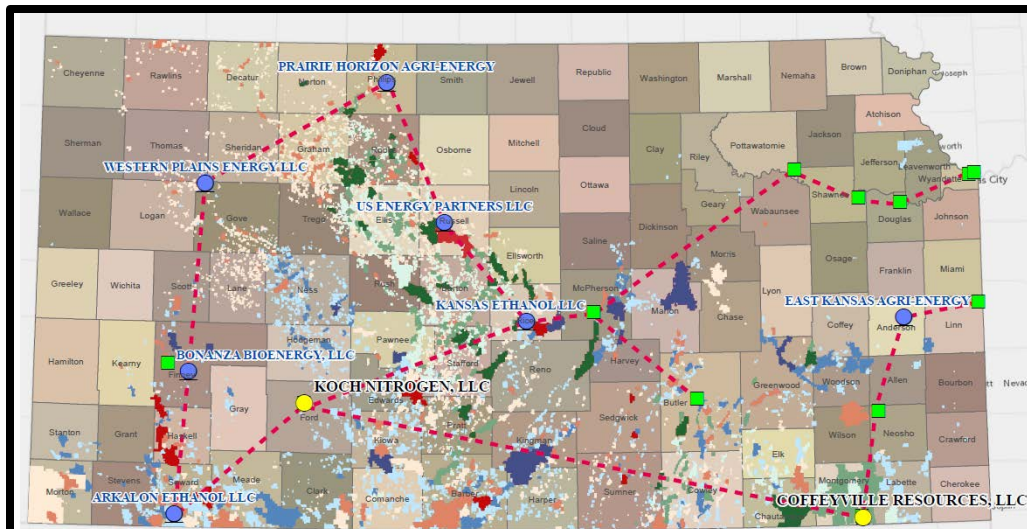

Lower Flow Unit For Regional Modeling in Arbuckle Group

Low K_v – Gasconade & Gunter Sandstone

Summary

- Arbuckle Group saline aquifer is stratigraphically and petrophysically heterogeneous
- Sufficient subsurface information available to adequately characterize the key petrophysical properties to estimate storage and injectivity
- Characterization and modeling accomplished by extensive collaboration
- Believe that the CO₂ plume can be cost effectively and safely managed beneath existing oil fields
