

Chester Incised Valley System, Haskell and Seward Counties, Kansas

Martin K. Dubois, John C. Youle, Peter R. Senior, Dennis E. Hedke, Eugene Williams, and Raymond P. Sorenson

Presented at the Kansas Geological Society

Southwest Kansas CO2 EOR Initiative Chester and Morrow Reservoirs

*Western Annex to Regional CO2
Sequestration Project (DE-FE0002056) run
by the Kansas Geological Survey*

Six Industry partners:

- Anadarko Petroleum Corp.
- Berexco LLC
- Cimarex Energy Company
- Glori Oil Limited
- Elm III, LLC
- Merit Energy Company

Support by:

Sunflower Electric Power Corp.

The SW Kansas part of project

- CO2 EOR technical feasibility study – Chester IVF and Morrow
- Part of larger KGS-industry CCS and EOR study
- Will not inject CO2 – paper study only
- Get fields in study “CO2-ready”

Technical Team:

	Project Role	Company
Martin Dubois	Team Lead, geo-model	Consultant - IHR LLC
John Youle	Core & depo-models	Consultant - Sunflower
Ray Sorenson	Data sleuth & advisor	Consultant
Eugene Williams	Reservoir engineering	Williams Petrol. Consultants
Dennis Hedke	3D Seismic	Consultant - Hedke & Sanger
Peter Senior	Reservoir modeling	MS student
Ken Stalder	Geotech	IHR, LLC
Susan Nissen	3D Seismic	Consultant
Lynn Watney	Project PI	KGS
Jason Rush	Project PI	KGS
John Doveton	Log Petrophysics	KGS
Paul Gerlach	Data support	Consultant - Charter

Modeling Status and Outline

Current project status (April, 2013) by field:

Pleasant Prairie South	3D geomodel and flow simulation complete
Eubank North Unit	3D geomodel and flow simulation underway
Shuck	3D geomodel under construction

Outline

Introduction

- Stratigraphic and geologic setting
- Fields' statistics and histories

Geology

- Evolution of Chester incision
- Valley fill and sequence stratigraphy

Modeling and Simulation

- Static 3D modeling
- Flow simulation

Fields in study in relation to Chester Incised Valley

(Above) Regional isopach of lowermost Chesterian incised valley fill (*Montgomery & Morrison, 2008*)

(Right) Four fields in study. Green – Oil; Brown – Oil and Gas. Grid is Township-scale (6 mi.).

Stratigraphic setting

System	Series	Stratigraphic Unit	
Pennsylvanian	Virgilian	Admire Wabaunsee Shawnee Douglas	☀
	Missourian	Lansing- Kansas City Gp.	☀
	Desmoinesian	Marmaton Gp. Cherokee Gp.	●
	Atokan	Atoka Gp.	●
	Morrowan	Morrow Gp.	●
Mississippian	Chesterian		●
		Chester Gp.	●
	Meramecian	Ste. Genevieve	●
		St. Louis	●
		Salem	
		Warsaw	
		Osage	
	Kinderhookian	Gilmore City/Hannibal	

Generalized stratigraphic column (Montgomery and Morrison, 1999).

Subcrop pattern for Mississippian strata, western Kansas (Ebanks, 1991).

Valley incision took place during exposure of the Meramecian. Subsequent Chesterian transgression, punctuated by still-stands filled the narrow, nearly linear valley with fine-grained reservoir sand.

Field statistics and histories

	Discovered by	Disc. Year	Development (pre-3D)	3D shot	Post 3D drilling	Water flood start	Inject ors	Oil Wells	Current Status	EUR - P&S (mbo)
Pleasant Prairie So	Helmrich & Payne	1990	Only 2 wells added pre-3D	1998	19 wells	2002	9	13	near end of waterflood	4,600
Eubank North	Anadarko Petroleum	1959	5 total by 1965; 9 total pre-3D	1995	26 wells	2004	11	24	downslope waterflood	7,500 est. from
Shuck	Anadarko Petroleum	1978	have not reviewed history	~1995	few	1989	~13	~22	waterflood end ~2000	7,900

Oil Volumes

Recovery Factor (% OOIP)

	Study	OOIP (mbo)	Primary (mbo)	Second. (mbo)	Ultimate	Primary	Second -ary	EUR - P&S
Pleasant Prairie South	SW Ks CO2 project	14,641	2,320	2,320	4,640	15.8%	15.8%	31.7%
Eubank North	Anadarko	21,177	3,484	4,035	7,519	16.5%	19.1%	35.5%
	SW Ks CO2 project	25,261	3,484	2,416	(thru 2012)	13.8%		TBD
Shuck	Anadarko actual history	23,542	3,546	4,352	7,898	15.1%	18.5%	33.5%

Eubank North Unit Geomodel OOIP is based on a seismic-defined valley that is slightly wider than that in Anadarko waterflood study

Shuck Field, Hitch and Etzold Units

Shuck Waterflood Units Unit

Discovered: **1978**
 Waterflood: **1989**
 Pre-WF: 3.53 mmbo
 Since WF: 4.28 mmbo
Cumulative: 7.81 mmbo

(Above) Production plots for Hitch and Etzold waterflood units in Shuck Field, normalized to waterflood initiation.

(Right) Isopach map of the net basal Chester sandstone, >8% porosity, contour interval 20 ft.

(from Kim, Philip, and Sorenson, 2010).

Pleasant Prairie South Field Summary

Chester IV (Pleasant Prairie South) cuts through Pleasant Prairie, a faulted anticline producing from the St. Louis (34 mmbo).

Producing zone	Miss. Chester
Discovered	1990
Waterflood	2002
Cumulative Oil	4.4 mmbo
Cumulative Gas	0.7 BCF

WF recovery	Appx 50% of cum.
Oil wells total	18*
Current oil wells	13
Current wtr inj wells	9

Geology

- Evolution of Chester incision
- Valley fill and sequence stratigraphy

Modeling and Simulation

- Workflow
- Static 3D modeling
- Flow simulation

Evolution of Chester Incision and Fill

Exposure and incision

- Mississippian carbonate rocks deposited on a broad relatively **shallow platform through Meramec**
- Widespread post-Meramecian **subareal exposure**
- **Deep fluvial incision** formed a nearly linear, narrow, deep valley in the Meramecian surface.
- Location of incision in places appears to have been **related to reactivated basement fractures and faults** and associated karst in the Mississippian and as deep as the Arbuckle
- Incised valley **may be more linear** over present day major positive structural features

Chester Incised Valley in Kansas

Vichita KS

Peasant Prairie South

Pleasant Prairie faulted anticline has produced 39 mbo primarily from the St. Louis. Pleasant Prairie South Chester IVF reservoirs have yielded 4.4 mbo.

Seismic depth-converted Meramec surface (*smoothed*). 1450 ft maximum width at top of valley.

Seismic interpretation by Hedke

Other Pleasant Prairie views with IVF wells

Pleasant Prairie IV related to deeper, older structure

Meramec Time Structure

- Down-to-west bounding fault with 60ms throw on Precambrian and Arbuckle. Possibly less throw at Meramec (if not accounted for by erosion/removal)
- Incised valley may be associated with basement fracture and deeper karst in Arbuckle
- Karsted Meramec surface evident in time structure

Interpretation work by Dennis Hedke

Eubank

Seismic depth-converted Meramec surfaces
Seismic interpretation by Hedke

Eubank – depth ties

Valley walls and irregular floor tied to well measured tops – same view, different perspective. Red dots are Meramec tops intersected by the depth-converted Meramec seismic surface. Isolated lows in valley floor, confirmed by well penetration, may be karst-related sink holes.

Chester Incised Valley Fill

Valley fill *(based on work by Youle and Senior, project technical team members)*

- As Chesterian seas overlapped the exposed Meramecian surface the valley was **filled by a fluvial-estuarine system** from south to north
- Incision still may have been occurring north of the Chester shoreline during fill south of the shoreline
- **Oldest Chester fill is to the south**, youngest is to the north.
- Depositional environments are more **marine and tidal-influenced to the south**. More **fluvial influence to the north**.

IVF Depositional Environment

Shuck and Eubank valley-fill sediments are primarily tidal-dominated estuarine-type deposits, although some are more related to Dalrymple et al's (1992) wave-dominated estuary system (Youle).

Pleasant Prairie South has more fluvial influence but still some tidal influence (Senior).

Dalrymple et al (1992) tide-dominated estuary model

Eubank – Depositional Facies and Petrofacies

- **Depositional facies** are lithofacies defined in core deposited in a similar depositional environment
- **Petrofacies** are lithofacies identifiable on wireline logs. Multiple depositional facies may be in same petrofacies class
- **Youle defined five petrofacies** in Eubank and Shuck that can be defined by log signatures

Petrofacies 5 (main pay lithofacies)
Figure 24. **Estuary Bar sandstone depositional facies, very-fine to fine-grained sandstone lithofacies.** Owens 3A core (MD 5465-5475).

Eubank Facies continued

Petrofacies 4 (below left)

Estuary Bar facies sandstones (Petrofacies 5) interbedded with shalier Estuary Bar Margin depositional facies, slightly shaley fine-grained sandstone lithofacies (Petrofacies 4). Facies are depositionally linked - deposited in immediately adjacent settings. (Hugoton Energy Black 4-3 core 5481-5491)

Chester Sequence Stratigraphy

work by John Youle

The cyclic retrogradational nature of Chester shoreline advances into Kansas are interpreted to have filled incised valleys with a series of 'back-stepping' stacked estuarine sandstone reservoirs. Red dashed lines are postulated sequence boundaries, and purple lines are possible parasequences. (Youle)

Parasequence Boundaries recognized in core

Key parasequence boundaries marking acceleration in Chester sea onlap are recognized in core and correlated with wireline logs in wells without core.

(Left) **Flooding Surface for PS3 at 5514.** Maximum flooding surface for PS3 is appx. 10 ft above this surface. (core 5509-5515)

(Right) **PS2 Flooding surface at 5581.5**, Estuary Bar and Bar Margin facies of PS 2 lying sharply above intertidal to supratidal “Salt Marsh” facies. (core 5579-5586)

(work by Youle)

Eubank North, Parasequences in logs and model

Four parasequences in North Eubank unit area. Wireline x-sec is not to scale. Model x-sec has true horizontal scale along similar path, but crosses “bumps” in straight line between wells rather than center of valley.

North Eubank Valley fill

Fence diagrams show lithofacies during valley fill stages (parasequences)

Pleasant Prairie South sequence stratigraphy

Two parasequences. Four
lithofacies (color key slide 23)

Pleasant Prairie South Model framework

1. **Incised valley** cuts through Meramec and into St. Louis during post-Meramec exposure
2. **Two distinct sedimentary cycles (PS1 and PS2)** are recognizable in core and correlated in on wireline logs
3. **Chester sediments are absent from highlands**

*Initial modeling work by Peter Senior.
Geomod2 by Dubois.*

Traps and Hydrocarbon Fill

Trapping mechanism

- Sandstone reservoir filling incised valley appear to be connected.
- Barriers to northward, updip flow **(traps) are structural in nature**.
- **Pleasant Prairie and Eubank IVF traps** occur where the valley “crosses” post-Chesterian faulted structures related to the Ouchita Orogeny and the development of the Anadarko Basin.
- Northern closure to the **Shuck field appears to be due to a very localized karst** (Sorenson, personal communication)

Hydrocarbon migration and fill

- Oil along the length of the valley are very similar and are **primarily of Woodford origin** (Anadarko Basin), but with a minor component being of Ordovician age (Kim et al, 2010)
- The Chester IVF system may have been a **primary route for the Woodford oil charging the reservoirs in the much of western Kansas** (Sorenson, personal communication)

Integrated Multi-Discipline Project

Geophysics:

structure, attributes, faults

Static Model

Geology:

Formation tops, sequence stratigraphy, core lithofacies, lithofacies prediction (NNet)

Petrophysics:

Core K-Phi, corrected porosity, free water level, J-function

Engineering:

PVT and fluid analysis, recurrent histories, dynamic modeling

Dynamic Model

Chester

conglomerate

pebbly sand

unconformity

St. Louis

Basic Workflow (Pleasant Prairie South)

Inputs

Framework data:

- Formation tops
- Sequence stratigraphy
- Depth-converted seismic structural surfaces
- Seismic attributes

Well-scale data

- Lithofacies (by NNet)
- Core data
- Porosity (corrected)
- Water saturation (Archies)

Sw solution

- Oil/water contacts and free water level
- Sw by Leverett J-function

Static Model

Structural wire frame model

- Incised valley by seismic and well tops
- Two parasequences
- 0-249 layers
- Cells: XY=55 ft, Z=2ft
- 700,000 active cells

Fine- grid cellular property model

- Lithofacies
- Porosity
- Permeability (XY)
- Water saturation
- OOIP

Dynamic Model

- ✓ History matched primary and secondary black oil simulation
- ✓ Forecast CO2 EOR compositional simulation

Upscale model

- Phi, K, Sw
- 0-25 layers
- Cells: XY=55 ft, Z=10 ft
- 65,000 active cells

	 pebbly ss
	 x-bedded ss
1 shale	 shale
2 basal congl	 basal congl

Pore throats, permeability, Sw are dependent on lithofacies

Pleasant Prairie

- Five core lithofacies have somewhat distinctive K-Phi trends (left), but are not all distinguishable on logs
- Lumped into two lithofacies, Sandstone and Conglomerate (right)

Pleasant Prairie South

Pore throats, hence permeability and capillary pressure (and Sw) are a function of lithofacies. Thus it is important to distinguish lithofacies in the characterization and modeling process

Eubank

- Lumped lithofacies in Eubank have very similar K-Phi relationships as Pleasant Prairie
- Eubank sandstone has very slightly lower permeability for a given porosity

Pleasant Prairie South Static Model Properties

Inputs: 25 valley wells with *Phi, Lithofacies and Sw*

Import LAS curves at half-foot sample rate

Upscale to layer scale (2-ft)

Model Lithofacies

- Data analysis and variograms
- Sequential indicator simulation

Model Porosity

- Data analysis and variograms by lithofacies
- Sequential Gaussian simulation by lithofacies

Calculate Kxy by lithofacies

Sandstone	$K(md) = 0.0047 * PHI^{3.9365}$
Conglomerate	$K(md) = 0.0033 * PHI^{2.9396}$
Shale	$K(md) = 0.01$

Estimate Sw by J-Function

Lithofacies and Porosity

Lithofacies

Porosity (0-25%)

Water Saturation and Permeability

Upscale to coarse grid and export for simulation

Fine-grid static model 2-ft h cells were upscaled to 10-ft h cells for simulation.

Black Oil Simulation

Reservoir simulation work by Eugene Williams

General workflow

1. Match fluid & pressure histories (1990-2011)
2. Define 12 patterns (polygons)
3. Modify properties to attain match
 - Pore volume modifiers by polygon
 - I-Permeability modifiers by polygon
 - I and J Transmissibility modifiers (by polygon)
 - Relative permeability
 - Psuedo-functions – Rocktype, VE, Stratified – by polygon
 - End points (SWCR, SOWR, KRW) by region
4. CMOST automation to run hundreds of iterations to get close
5. QC and manual inputs for final

Simulation model views

Field History - review

Field-scale matches (through waterflood)

Lighter colored are actual, darker are modeled

CO2 EOR Projections

Assumptions:

1. Convert WIW to CO2 IW
2. Oil wells as is
3. Inject 5 mmcf/d CO2, not exceeding bhp 2600 psi
4. Continuous CO2, no WAG
5. Injection = production
6. No optimization

Projections:

OIL (mmbo)

Cumulative 2011	4.48

Pleasant Prairie South Simulation

Detailed report available online: Appendix A of quarterly DOE report, p 50-143: http://www.kgs.ku.edu/PRS/Ozark/Reports/2012/Q11_2012_v2.pdf

The purpose of the simulation model is to demonstrate incremental volume of oil that might be generated with CO₂ injection and to determine the volume of CO₂ that might be sequestered.

There is room for improvement in the static model and justification for further dynamic modeling, but the current models are sufficient to demonstrate with confidence that substantial volumes of CO₂ can be injected and sequestered and a significant volume of oil recovered in the process.

Dynamic flow modeling required a pore volume reduction to a volume-weighted average of 79% of static model pore volume for the best history match of primary and secondary production. This could indicate that 21% of the reservoir is excess volume, or 21% of the modeled reservoir was not in communication with the wellbores.

The volume of potential oil recovered might be significantly less if residual oil to miscible CO₂ is greater than the zero value assumed in these model predictions.

Summary

1. Generous operator contributions of data has allowed comprehensive study of Chester IVF system
2. Post-Meramec incision was filled by tidally dominated estuarine sediments to south and more fluvial to the north
3. Trapping mechanism is structural in nature for the three fields studied
4. Shuck, Eubank North Unit, and Pleasant Prairie South were prolific in primary and water flood phases.
5. Based on relatively simple modeling and simulation, the fields should be good CO2 flood candidates provided a source of CO2 can be found
6. Substantial model and flow simulation improvements are advisable prior to implementing CO2 floods based on these studies
