Table

Table 1—List of Kansas wells drilled into Precambrian rocks 6

Introduction

This is the latest report in a series of lists of oil and gas exploration wells in Kansas that have penetrated Precambrian rocks. This report is a compilation of verified basement test wells drilled through December 1983. Additionally, every effort has been made to correct errors, however slight, in the earlier work. The total number of wells drilled to the Precambrian in Kansas, as of December 1983, was 3,479.

List of wells drilled to the Precambrian

The list of wells (table 1) is arranged in geographic order by township and range, for the west ranges and then for the east ranges. Each entry includes a state-county code, name of the well, location, surface elevation, drilled depth to Precambrian rock, subsea elevation of this depth, the type of Precambrian rock encountered, the stratigraphic unit overlying the Precambrian, total depth of the well, and the year in which it was drilled, in that order. Keys to the abbreviations used in table 1 are provided below.

Current research

The data presented in this report will be used to update an earlier map of the configuration of the top of the Precambrian rocks in Kansas (Cole, 1976). Documented penetrations of basement rocks are important in providing samples for age determination, in measurement of magnetic susceptibility, and in defining the surface of the Precambrian. Most basement tests are drilled in areas where there is already an abundance of other such wells. The senior author has made a major attempt to obtain samples from outpost basement tests to establish the characteristics of the basement rocks in those more remote locations. The cooperation of the operators to the extent of their willingness to provide additional samples and other documentation of the basement penetrations has been essential to the success of this project. Moreover, appreciation is extended to those who have routinely sent samples from the Precambrian tests to the Wichita Well Sample Library.

Magnetic and gravity surveys require information about the depth and composition of the basement for more precise interpretation. This interpretation includes the definition of geophysical terranes which can in turn be translated into geologic subdivisions of the basement. The Kansas Geological Survey and the University of Kansas are actively involved in these research efforts. Such geophysical surveys are being increasingly applied to the search for petroleum and minerals. For example, Precambrian sediments (the Rice Formation) associated with the Midcontinent Geophysical Anomaly (MGA) have been suggested as possible sites for petroleum accumulation (Lee and Kerr, 1983). The definition of this stratum has been accomplished primarily through interpretation of geophysical data. However, the few available basement samples have provided the foundation for the interpretation. Yarger and others (1981) have recently published an aeromagnetic map of Kansas, and Yarger (1983) interpreted this magnetic data using a series of digitally filtered maps. A Bouguer gravity map is also now available for eastern Kansas (Yarger and others, 1985). Gravity data for western Kansas is being collected and processed.

A significant, deep Precambrian test was drilled by Texaco U.S.A. in 1984, after completion of this list. The well drilled in sec. 31, T. 5 S., R. 5 E., Washington County, Kansas, was testing for petroleum in the Precambrian sediments along the Midcontinent Geophysical Anomaly (MGA). The #1-31 Noel Poersch, however, was reported as abandoned in March 1985. Information on the well has been filed with the State of Kansas and will be confidential until May 1987.

Bickford and others (1979) have prepared a preliminary map of the Precambrian rock types in Kansas based on their studies of lithology, geochemistry, and geochronology of these rocks in Kansas. Another report of a similar nature on Kansas and Missouri basement rocks has also been prepared by Bickford and others (1981) and more recently on the central United States (Denison and others, 1984).

The seismology of the Midcontinent is another integral part of the efforts to understand the geology of the Precambrian basement. The network of seismometers in Kansas and adjoining states has permitted collection of information on microearthquakes during the past eight years. Long-term compilation of these events will perhaps be very useful in understanding patterns of discontinuities in the basement rocks including faults and will assist in further defining basement terrane (Steeples, 1980, 1982).

The recent acquisition of a deep-penetrating, reflection seismic profile over north-central Kansas resulting from the Consortium for Continental Reflection Profiling Program (COCORP) has stimulated efforts to understand the nature of basement rocks, particularly those related to the Midcontinent Geophysical Anomaly (MGA) (Brown and others, 1985; Serpa and others, 1984). The west-to-east seismic line crosses the MGA and has supported the interpretation of this geophysical anomaly as an aborted Precambrian rift referred to as the Central North American Rift System (CNARS). According to this seismic information, the Keweenawan-age Precambrian Rice Formation, the terrigenous clastic fill in the rift, may be considerably thicker than once believed, to the extent of 10,000 ft or more.

Much remains to be learned about the distribution of Precambrian terranes and structures and their influence on the overlying Paleozoic sedimentary succession. The availability of Precambrian samples for description and analysis will continue to be an essential ingredient to this research.

ACKNOWLEDGMENTS—Results of research such as those cited above are testimony to the farsightedness of the Basement Rock Committee of the Kansas Geological Society, whose members initiated the interest in accumulating information on Precambrian rocks in Kansas. Without the cooperation of the oil and gas industry this effort would not have been possible. We gratefully acknowledge the assistance of W. J. Ebanks, Jr. in previous publications of this list and to Young Woo Chang and Stephen Wai Leung Cheng for their computer programming support.

Postscript: With deep regret and sadness expressed by his many friends and family, Virgil B. Cole passed away on January 16, 1984. Virgil was the major force behind the Precambrian sampling program since its beginning until the time of his death. His dedication and perseverance were outstanding. His knowledge of the general geology of the state of Kansas would be difficult for anyone to surpass. He was highly regarded by his geological associates in academia and in the petroleum industry that he so well served. This splended individual will not be forgotten.
